

# Kolmogorov-Pearson diffusions and hypergeometric functions

Ichiro SHIGEKAWA (Kyoto University)

## 1 Introduction

We consider diffusions generated by  $\mathfrak{A} = a\frac{d^2}{dx^2} + b\frac{d}{dx}$ . Here  $a$  is a quadratic function and  $b$  is a linear function. We call these diffusions as Kolmogorov-Pearson diffusions. We are interested in spectra of these generators. We want to determine all spectra completely. To do this, hypergeometric functions play an important role.

## 2 Several expressions of generators

Our generators are of the form

$$\mathfrak{A} = a\frac{d^2}{dx^2} + b\frac{d}{dx} \quad (1)$$

where  $a$  is quadratic and  $b$  is linear. Following Feller, we can associate a measure  $dm$  and a function  $s$ .  $dm$  is called a speed measure and  $s$  is called a scale function. In our case,  $dm$  has a density  $\rho$  of the form  $\rho = \exp\{\int(f/g)dx\}$  where  $f$  is linear and  $g$  is quadratic. We call this type of density as Pearson density. Pearson considered probability densities but we may admit infinite measure cases.  $s$  defines a measure  $ds$  and it has of the form  $ds = \frac{1}{a\rho}dx$ .

Using  $a$  and  $\rho$ ,  $b$  can be expressed as  $b = a' + a(\log \rho)'$ .

Now we can give several expressions of the generator as follows:

	generator	duality	differential operator
Kolmogorov	$a\frac{d^2}{dx^2} + b\frac{d}{dx}$		
Feller	$\frac{d}{dm} \frac{d}{ds}$	$\frac{d}{dm} = -\frac{d^*}{ds}$	$\frac{d}{ds} : L^2(dm) \rightarrow L^2(ds)$
Stein	$\left(a\frac{d}{dx} + b\right)\frac{d}{dx}$	$a\frac{d}{dx} + b = -\frac{d^*}{dx}$	$\frac{d}{dx} : L^2(\rho dx) \rightarrow L^2(a\rho dx)$

Using this, we can make following correspondences.

Feller's pair	$\frac{d}{dm} \frac{d}{ds} \longleftrightarrow \frac{d}{dm} \frac{d}{ds}$
Stein's pair	$\left(a\frac{d}{dx} + b\right)\frac{d}{dx} \longleftrightarrow \frac{d}{dx}\left(a\frac{d}{dx} + b\right)$

One important thing is that the class of Kolmogorov-Pearson diffusions are closed under Feller's pair and Stein's pair. From these pairings, we can show that

- If  $f$  is an eigenfunction, then so are  $f'$ ,  $\frac{d}{ds}f$ .
- If  $\theta$  is an eigenfunction, then so are  $a\theta' + b\theta$ ,  $\frac{d}{dm}\theta$ .

According to the degree of  $a$ , our generators are classified as

	complete family	incomplete family		special function
$\alpha$ -family	$a = 1$			$F_1^0$
$\beta$ -family	$a = x$	$a = x^2$		$F_1^1$
$\gamma$ -family	$a = x(1 - x)$	$a = x(1 + x)$	$a = 1 + x^2$	$F_1^2$

Further, associated speed measures are given as follows:

	complete family	incomplete family	
$\alpha$ -family	$e^{\beta x^2/2}$		
$\beta$ -family	$x^\alpha e^{\beta x}$	$x^\alpha e^{\beta/x}$	
$\gamma$ -family	$x^\alpha (1 - x)^\beta$	$x^\alpha (1 + x)^\beta$	$(1 + x^2)^\alpha \exp\{2\beta \arctan x\}$

### 3 Spectra of generators

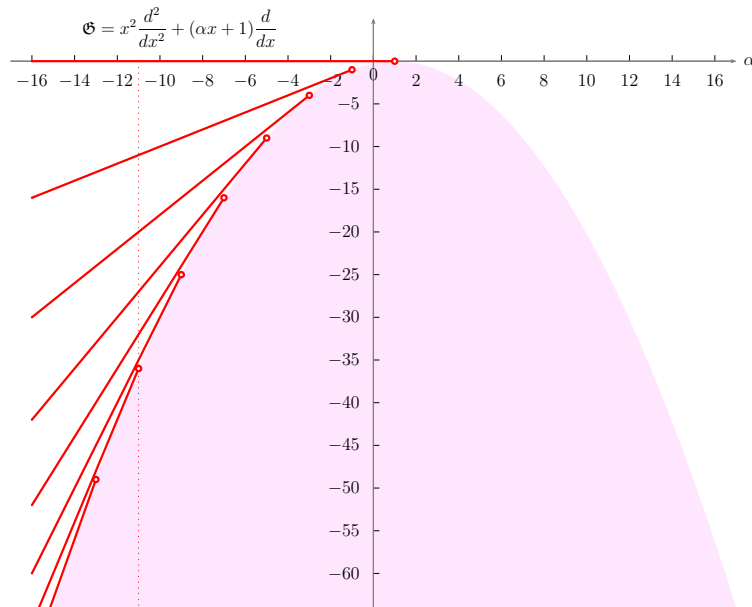

We have the following six cases:

(i)  $a = 1$ , (ii)  $a = x$ , (iii)  $a = x^2$ , (iv)  $a = x(1 - x)$ , (v)  $a = x(1 + x)$ , (vi)  $a = 1 + x^2$ .

We have discussed (i) and (ii) in the previous occasion. We will discuss here (iii) – (vi). In the case of (iii), the generator has the following form:

$$\mathfrak{A} = x^2 \frac{d}{dx^2} + (\alpha x - \beta) \frac{d}{dx}. \quad (2)$$

In particular, in the case  $\beta = -1$ , spectra are given as

Other cases will be discussed in the talk.
